THE LIST OF REVIEWERS OF EcoTER'26

- Dr Lidija Mančić, Institute of Technical Sciences of the Serbian Academy of Sciences and Arts, Belgrade (Serbia)/Pontifical Catholic University of Rio de Janeiro, Rio de Janeiro (Brasil)
- Dr Tanja Brdarić, University of Belgrade, Vinča Institute of Nuclear Sciences – National Institute of the Republic of Serbia, Belgrade (Serbia)
- Prof. Dr Matej Fike, University of Maribor, Faculty of Energy Technology, Krško (Slovenia)
- Dr Dragana Randelović, Institute for Technology of Nuclear and Other Mineral Raw Materials, Belgrade (Serbia)
- Prof. Dr Grozdanka Bogdanović, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Snežana Milić, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Tamara Rakić, University of Belgrade, Faculty of Biology, Belgrade (Serbia)
- Dr Dragana Adamović, Mining and Metallurgy Institute Bor, Bor (Serbia)
- Prof. Dr Ivana Savić Gajić, University of Niš, Faculty of Technology, Leskovac (Serbia)
- Dr Ljiljana Avramović, Mining and Metallurgy Institute Bor, Bor (Serbia)
- Dr Mirjana Marković, University of Belgrade, Vinča Institute of Nuclear Sciences – National Institute of the Republic of Serbia, Belgrade (Serbia)
- Dr Viša Tasić, Mining and Metallurgy Institute Bor, Bor (Serbia)
- Dr Stefan Đorđević, Mining and Metallurgy Institute Bor, Bor (Serbia)
- Dr Dragana Božić, Mining and Metallurgy Institute Bor, Bor (Serbia)
- Prof. Dr Jelena Mitrović, University of Niš, Faculty of Sciences and Mathematics, Niš (Serbia)
- Prof. Dr Miloš Ilić, University of Novi Sad, Faculty of Sciences, Novi Sad (Serbia)
- Prof. Dr Vesna Grekulović, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Ivana Marković, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Ana Radojević, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Tanja Kalinović, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Žaklina Tasić, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Slađana Alagić, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Ana Simonović, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Milica Veličković, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Maja Nujkić, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Milan Gorgievski, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Prof. Dr Ljubiša Balanović, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Asst. Prof. Dr Jelena Kalinović, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Asst. Prof. Dr Jelena Jordanović, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)
- Asst. Prof. Dr Vladimir Nikolić, University of Belgrade, Technical Faculty in Bor, Bor (Serbia)

PREFACE

The 32nd International Conference *Ecological Truth & Environmental Research – EcoTER'26* has been dedicated for more than three decades to presenting the latest scientific achievements, research findings, and innovative approaches in the fields of ecology, environmental protection, and sustainable development. In 2026, the conference was held in Sokobanja, Serbia, at Hotel Sunce, from 24 to 26 June.

The primary aim of the conference is to bring together leading experts, researchers, professionals, and young scientists from diverse fields in order to foster the exchange of knowledge, strengthen scientific collaboration, and promote innovative solutions to contemporary environmental challenges. By connecting science, education, industry, and society, EcoTER'26 seeks to inspire the transformation of attitudes and practices in everyday life, as well as within economic and industrial systems, contributing to a more sustainable future.

The 32nd International Conference *Ecological Truth & Environmental Research – EcoTER'26* is organized by the University of Belgrade, the Technical Faculty in Bor, with the co-organization of the University of Banja Luka, the Faculty of Technology; the University of Montenegro, the Faculty of Technology – Podgorica; the University of Zagreb, the Faculty of Metallurgy – Sisak; the University of Pristina, the Faculty of Technical Sciences – Kosovska Mitrovica; and the Association of Young Researchers – Bor (Serbia).

The Proceedings of EcoTER'26 include 98 scientific papers authored by researchers, academics, and industry representatives from universities, research institutions, and organizations across the following countries: Bosnia and Herzegovina, Bulgaria, the Czech Republic, Finland, Italy, Montenegro, North Macedonia, Pakistan, Romania, Slovenia, the Netherlands, the United Kingdom, the United States of America, Uzbekistan, and Serbia. It is our great honour and pleasure to welcome all participants and contributors and to express our sincere appreciation for their valuable scientific contributions.

Within this year's conference programme, the 7th Student Section – EcoTERS'26 was also organized. We highly value the contribution of students and their mentors, whose enthusiasm, creativity, and dedication represent an important foundation for the advancement of scientific knowledge. We encourage young researchers to continue exploring, questioning, and expanding the boundaries of knowledge, recognizing that education and scientific discovery are lifelong processes.

The support of our donors, together with their commitment, trust, and willingness to cooperate, has significantly contributed to the successful organization of the conference. The Organizing Committee expresses its deepest gratitude to the Platinum donors of the conference – Serbia Zijin Mining DOO Bor and Serbia Zijin Copper DOO Bor; the Gold donors – HBIS SERBIA, the Serbian Chamber of Engineers, and Elixir Prahovo; and the Silver donor – Rudex Explosives.

We extend our sincere appreciation to all authors who contributed to these Proceedings. Special recognition is given to the members of the Scientific, Organizing, and Honorary Committees, reviewers, invited speakers, session chairs, and all participants whose dedication and support have contributed to the success and continuity of EcoTER.

Our sincere gratitude goes to everyone who has contributed to the organization and delivery of this conference. Your efforts and collaboration continue to strengthen the mission of EcoTER and its role in promoting scientific excellence, environmental responsibility, and sustainable development.

Prof. Dr Ana Radojević

President of the Organizing Committee

TABLE OF CONTENTS

Plenary Lectures

Jay Wadhawan

DROPLET ELECTROCHEMISTRY: FROM LABORATORY TO INDUSTRIAL APPLICATIONS 1

Grozdanka Bogdanović

FROM WASTE TO RESOURCE: A SUSTAINABLE APPROACH TO LEACHING OF SULFIDIC TAILINGS 2

Invited Lectures

Vesna Vučurović

BIOETHANOL AS A RENEWABLE ENERGY SOURCE: EFFICIENCY, SUSTAINABILITY, AND ENVIRONMENTAL IMPACT 5

Bojana Bajić, D. Vučurović, S. Dodić

BIOPROCESS ENGINEERING FOR CIRCULAR BIOECONOMY: MODELLING, OPTIMIZATION AND VALORISATION OF AGRO-INDUSTRIAL RESIDUES AND WASTES 12

Ana Simonović

APPLICATION OF ENVIRONMENTALLY SAFE INHIBITORS FOR METAL CORROSION PROTECTION 18

Ivan Savić, I. Savić Gajić, T. Palanački Malešević, I. Mihalj Lubašćik, Z. Svirčev, J. Meriluoto

PAN-LIFE-CARPET CONCEPT: INTEGRATING WASTE VALORIZATION AND BIOCRUST ENGINEERING 22

Jovana Bezdan, A. Bezdan

NATURE-BASED SOLUTIONS UNDER CLIMATE CHANGE: AN OVERVIEW OF KEY FINDINGS FROM THE UNSFA PILOT SITE WITHIN THE DALIA AND SWIM PROJECTS 29

Conference Papers

Žarko Radović, N. Tadić

EFFECT OF AIR OXYGEN ENRICHMENT AND EXCESS AIR RATIO ON SOLID FUELS COMBUSTION 40

Nebojša Tadić, I. Nikolić, N. Jovović, A. Drakulović, V. Radmilović STRENGTH AND MICROSTRUCTURE OF FLY ASH BASED GEOPOLYMERS CONTAINING WASTE PLASTIC	46
Aleksandra Papludis, S. Alagić, S. Milić, D. Medić, J. Nikolić, V. Stankov Jovanović, G. Stojanović AN ASSESSMENT OF THE PRESENCE OF DIBENZ(a,h)ANTHRACENE, A PROBABLE HUMAN CARCINOGEN, IN THE BOR REGION, ON THE BASIS OF ITS CONTENT IN STEMS AND LEAVES OF COMMON IVY, LILAC, AND FIG	51
Aleksandar Cvetković, Ž. Tasić, M. Petrović Mihajlović, A. Simonović, M. Radovanović, A. Bogdanović, M. Antonijević, S. Stanković ELECTROCHEMICAL SENSING OF CAFFEINE	57
Milutin Stojadinović, V. Marjanović, I. Svrkota FUNDAMENTALS OF WASTE CHARACTERISATION SAMPLING ACCORDING TO CEN/TR 15310	63
Boris Novaković, N. Paskaš, Z. Stojanović, V. Lakušić, I. Živić ENVIRONMENTAL VARIABLES AFFECT DISTRIBUTIONAL PATTERNS OF THE RIFFLE BEETLE (Coleoptera: Elmidae) SPECIES IN THE SERBIAN STREAMS AND RIVERS	71
Boris Novaković, J. Đuknić, N. Paskaš, M. Raković, V. Lakušić, I. Živić RIFFLE BEETLE <i>Elmis maugetii</i> Latreille, 1802 (Coleoptera: Elmidae): NOTES ON THE SPECIES' MORPHOLOGICAL PLASTICITY IN THE BALKAN PENINSULA	78
Radenka Kolarov, Dj. Petrov, N. Galečić, D. Skočajić, J. Čukanović, S. Đorđević, M. Ocokoljić CHALLENGES, LIMITATIONS AND KNOWLEDGE GAPS CONCERNING ALLOCHTHONOUS TREES IN URBAN ENVIRONMENTS: WINGED ELM	83
Radenka Kolarov, Dj. Petrov, N. Galečić, D. Skočajić, J. Čukanović, S. Đorđević, M. Ocokoljić THE INFLUENCE OF THE URBAN HEAT ISLAND ON <i>Abelia</i> × <i>grandiflora</i> (ROVELLI EX ANDRÉ) REHDER TAXA	85
Radenka Kolarov, Dj. Petrov, N. Galečić, D. Skočajić, J. Čukanović, S. Đorđević, M. Ocokoljić <i>Pyracantha angustifolia</i> (Franch.) C.K.SCHNEID. A NEW EXOTIC SPECIES IN THE DENDROFLORA OF BELGRADE	93
Milena Nikolić, A. Zdravković, D. Marković Nikolić, D. Stojadinović, T. Nikolić EVALUATION OF ECOLOGICAL POTENTIAL OF VETERNICA RIVER BASED ON CHEMICAL QUALITY PARAMETERS	100

Abstract

The increasing demand for environmentally friendly electronic materials has encouraged the development of lead-free solder alloys and sustainable production technologies. Despite numerous alternatives, the eutectic Sn-0.7Cu alloy has been recognized as a promising candidate for lead-free solder applications due to its low cost, acceptable mechanical properties, and compliance with RoHS and WEEE regulations. This study investigates the effect of graphene nanoparticles, in the form of graphene nanosheets (GNS), on the microstructural and mechanical properties of Sn-0.7Cu matrix composites produced via powder metallurgy. GNS was incorporated into the matrix in small weight fractions (0, 0.02, 0.04, 0.06, 0.08, and 0.10 wt.%) to promote microstructural refinement and enhance the mechanical properties of the composites. Optical microscopy was used to characterize the microstructure of the sintered samples, while microhardness was measured using the Vickers method. The results indicate that increasing the graphene content significantly refines the grains, reducing the average grain size by approximately 54 % and increasing the microhardness by about 16 % compared to the base alloy.

Keywords: lead-free solder, graphene nanoparticles, powder metallurgy, composites.

INTRODUCTION

The electronics industry faces growing demands to develop materials that combine high performance with environmental sustainability. The replacement of toxic Sn-Pb solders with lead-free alternatives has been strongly encouraged by environmental regulations such as the RoHS and WEEE Directive [1]. Among lead-free systems, eutectic Sn-0.7Cu solder is widely used due to its ecological acceptability, relatively low cost, excellent wettability, and satisfactory soldering performance. However, its mechanical properties are lower than those of eutectic Sn-Pb and Sn-Ag-Cu solders, potentially affecting the reliability of soldered joints

* mnedeljkovic@tfbor.bg.ac.rs

[2]. The incorporation of reinforcement phases through composite technology provides an effective strategy for improving the performance of Sn–Cu solder.

Over the past decade, nanocomposite solders obtained by incorporating nanoparticles into conventional solders have been extensively investigated to improve the performance of solder joints under various service conditions [3]. Numerous studies have employed various types of nanoparticles to modify lead-free solders. However, to date, relatively few studies have focused on the incorporation of carbon-based nanomaterials, particularly graphene, which has attracted significant interest in advanced materials research due to its outstanding properties. [4]. Graphene, in the form of graphene nanosheets (GNS), is a two-dimensional carbon nanomaterial with exceptional mechanical strength, high thermal and electrical conductivity, and a large specific surface area, making it an ideal reinforcement phase for enhancing the properties of metal matrix composites [5].

Among the various techniques available for adding reinforcements to a solder matrix, powder metallurgy (PM) is the most frequently used. From a sustainability perspective, this technique offers an efficient processing route that minimizes material waste, enables near-net-shape production, and provides precise control over composition. Compared to conventional casting, PM can reduce energy consumption and lower environmental impact [6].

The main focus of this research is to investigate the effect of small amounts of GNS on the microstructure and microhardness of the Sn-0.7Cu based composites. The composites were synthesized using the PM technique, and the results were compared with those of the base alloy.

MATERIALS AND METHODS

Materials used in this study included atomized tin (Sn) and copper (Cu) powders, with particle sizes up to 75 μm , and GNS with an average diameter of 5–10 μm and a thickness of 3–5 nm. Six different compositions, Sn-0.7Cu/xGNS ($x = 0, 0.02, 0.04, 0.06, 0.08, \text{ and } 0.10 \text{ wt.}\%$) were synthesized. For each composition, the corresponding powders were first mixed in a “Turbula T2F” three-axis mixer at 50 rpm for 30 hours to produce the Sn-0.7Cu matrix powder. The matrix powder and GNS were then mechanically alloyed in a high-energy planetary ball mill “FRITSCH Planetary Ball Mill P-7” at 100 rpm for 3 hours to ensure a uniform distribution of GNS within the matrix. The resulting powder mixture was cold compacted using a “Mohr-Federhaff-Losenhausen” hydraulic press under a uniaxial pressure of 300 MPa. Compacted samples were then sintered in a furnace at 185 °C for 3 hours in an argon atmosphere to obtain the final specimens.

The microstructural analysis of the sintered samples was performed using a “Reichert MeF2” optical microscope at a magnification of 1000x. After standard metallographic preparation by grinding and wet polishing, the samples were etched with a solution of (2 mL HCl + 98 mL of 95 % methanol).

The microhardness of the samples was measured in accordance with the ASTM E384 standard [7] using a PMT-3 Vickers microhardness tester. To ensure reliable results, the sample surfaces were carefully ground and polished. A pressing force of 0.05 N and a load

duration of 15 seconds were applied. Each measurement was repeated six times, and the average value was calculated.

RESULTS AND DISCUSSION

Figure 1 shows the optical microphotographs of the investigated sintered samples with different GNS contents. The microstructure of the Sn-0.7Cu base alloy is shown in Figure 1a, while Figures 1(b–f) illustrate the microstructures of the samples containing GNS. It can be observed that the addition of reinforcement particles significantly reduces the grain size, as confirmed by measurements of the average grain size using ImageJ software (Figure 2). The average grain size continuously decreased from 27.19 μm to 12.64 μm with increasing GNS content. The Sn-0.7Cu/0.10GNS composite exhibited the finest microstructure, with approximately 54 % lower grain size than the Sn-0.7Cu base alloy.

Figure 1 Optical microphotographs of the sintered Sn-0.7Cu/xGNS samples: a) Sn-0.7Cu; b) Sn-0.7Cu/0.02GNS; c) Sn-0.7Cu/0.04GNS; d) Sn-0.7Cu/0.06GNS; e) Sn-0.7Cu/0.08GNS; f) Sn-0.7Cu/0.10GNS

Microstructural analysis indicated that the addition of GNS affected the grain morphology of the composites. Optical micrographs showed that the grains are polygonal with well-defined boundaries. The microstructure is heterogeneous, showing variations in grain size, which may be attributed to the non-uniform distribution of GNS during the powder metallurgy process. Porosity is minimal, indicating good consolidation of the powder during the sintering process. At this magnification, GNS particles are not visible. GNS reinforced samples exhibited significant grain refinement and a more homogeneous microstructure

compared to the base alloy. The observed grain refinement can be attributed to the role of GNS as a barrier to grain growth during sintering. The presence of GNS at the grain boundaries may inhibit atomic diffusion, reducing grain boundary mobility and resulting in a finer microstructure. Similar findings were also reported by Yang *et al.* in their study [8].

Figure 3 illustrates the effect of different contents of GNS on the microhardness of the sintered Sn-0.7Cu/xGNS samples. The results indicate a linear trend of increasing microhardness with increasing GNS content. The Sn-0.7Cu base alloy exhibits a microhardness of 18.72 HV_{0.05}, while composite Sn-0.7Cu/0.10GNS has a microhardness of 21.65 HV_{0.05} (15.65 % higher than the Sn-0.7Cu base alloy). This enhancement can be attributed to the grain refinement induced by GNS, as well as the restriction of dislocation movement at the grain boundaries, where GNS particles act as barriers during deformation. These findings are consistent with the observations by Yin *et al.* [9], confirming that even small additions of GNS significantly improve the mechanical properties of the composites.

Figure 2 Effect of GNS content on the average grain size

Figure 3 Effect of GNS content on the microhardness

CONCLUSION

In this study, Sn-0.7Cu based composites reinforced with GNS (0, 0.02, 0.04, 0.06, 0.08, and 0.10 wt.%) were successfully fabricated using the powder metallurgy technique. From a green engineering perspective, the PM process applied in this study offers several environmental advantages compared to conventional casting processes. Unlike traditional solder production, which requires complete melting of the alloy at temperatures typically above 250 °C, the PM process involves sintering at a significantly lower temperature of 185 °C. This reduced processing temperature directly lowers energy consumption during manufacturing and consequently decreases CO₂ emissions. Additionally, PM enables near-net-shape fabrication, which minimizes material waste and reduces oxidation losses commonly occurring during repeated melting operations. Material utilization efficiency in PM processing is typically above 95 %, contributing to improved resource efficiency.

Overall, the incorporation of very small amounts of GNS (≤ 0.10 wt.%) results in a significant increase in microhardness ($\approx 16\%$) and considerable grain refinement ($\approx 54\%$), enhancing the long-term reliability of solder joints. These improvements can extend the service life of electronic components and reduce e-waste. The combination of lower energy

demands, high material efficiency, and improved functional properties demonstrates that the developed Sn-0.7Cu/xGNS composites offer a sustainable solution for lead-free electronics applications.
